There are only 3 things certain in life:

Death, Taxes, and Data Loss

There isn't much we can do about death and taxes, but we can do a great deal about the prevention of data loss. Here at DCMS we have taken a different approach to data protection by focusing on what you really need, consistently reliable data recovery. DCMS Data Security is designed around efficient, intelligent data movement —making it easy for you to browse and find your data, to select as little or as much as you need to restore, and then to recover it quickly and efficiently.

02 The Business Challenge

Managing data is usually about managing costs: the cost of disk and tape required to store data, the cost of the time required to manage the backup jobs to completion, the cost of delays when data cannot be found and restored quickly.
Typically, data protection is more of a problem than a solution.

DCMS Data Security is designed to self-manage so that you can spend your time on something more productive than double-checking your backup. Point-and-click reporting saves you time and provides useful statistics for tuning your data protection environment.

03 Offsite Backups

Human error has been cited as one of the biggest reasons why a backup fails. Remove the human from the backup procedure and reliability increases exponentially. The DCMS Offsite Backup Solution eliminates the need for human intervention, thereby vastly improving the reliability of the backup, and viability of the restore. We offer seamless integration with industry-leading technology.

04 Restoration

Whether you need to restore a single file or an entire server, our backup solution can do it. With the DCMS Data Security, you can confidently restore your data. Any authorized end user through a simple interface can restore a single file without the need to call IT, thereby saving valuable resources and time.

05 Disaster Recovery

Is your business at risk? It is not a matter of IF you will suffer a disaster, but WHEN. It may not come as an earthquake, a devastating fire, or a flood; it may be a hardware failure, or a malicious act by an employee. Either way, your data is gone and your business at risk. DCMS has the answer to your disaster recovery problems, from a single file to the whole of your data; we have a solution that will fit your business and your budget.

06 Virtual Servers

As one of the offerings in our DCMS Data Security suite of tools, we offer Virtual Servers. Once exclusively for the "Mega Corporations" we offer it to all companies that require maximum uptime, no data loss and minimum hardware investment.

Our DCMS Data Security Solutions provide the greatest ROI with total confidence. You will be able to restore your data in full, in a trice and when you need it.

07 Terms & Definitions

Backup
The procedure for making a separate copy or copies of data with which somebody is working.

Disaster
An event that causes serious loss, destruction, hardship, unhappiness, or death.

Restore
The ability to successfully reinstate data from a backup.

ROI
Return on Investment

Trice
A very short moment in time.

Virtual Server
The ability to run a number of "servers" (including applications) independently on single piece of hardware.
